M3 Technical Specification

Moulding Width (Using Rebate Clamp)	0-60mm
Moulding Width (Without Clamp)	0-100mm
Moulding Height	0-100mm
Pin Placement from Back Corner	0-110mm
Wedge Sizes	7 to 15mm
Underpinner Dimensions (WxDxH)	730mm x 800mm x 1110mm
Weight	30kg
Warranty	1 year

GENERAL SAFETY RULES

WARNING: Do not attempt to operate the machine until you have read thoroughly and understood completely all instructions, rules, etc. contained in this manual. Failure to comply may result in accidents involving serious personal injury. Keep this owner's manual and review frequently for continuous safe operation.

1. Know your machine. For your own safety, read the owner's manual carefully. Learn its application and limitations, as well as specific potential hazards pertinent to this machine.

2. Keep guards in place and in working order. If a guard must be removed for maintenance or cleaning, make sure it is properly replaced before using the machine again.

3. Remove adjusting keys and spanners. Form a habit of checking to see that the keys and adjusting spanners are removed from the machine before operating it.

4. Keep your work area clean. Cluttered areas and workbenches increase the chance of an accident.

5. Do not use in dangerous environments. Do not use power tools in damp or wet locations, or expose them to rain. Keep work areas well illuminated.

6. Keep children away. All visitors should be kept a safe distance from the work area.

7. Use the right tools. Do not force the machine or attachments to do a job for which they are not designed. Contact the manufacturer or distributor if there is any question about the machine's suitability for a particular job.

8. Wear proper apparel. Avoid loose clothing, gloves, ties, rings, bracelets, and jewellery which could get caught in moving parts. Non-slip footwear is recommended. Wear protective hair covering to contain long hair.

9. Always use safety glasses. Normal spectacles only have impact resistant lenses. They are not safety glasses.

10. Do not over-reach. Keep proper footing and balance at all times.

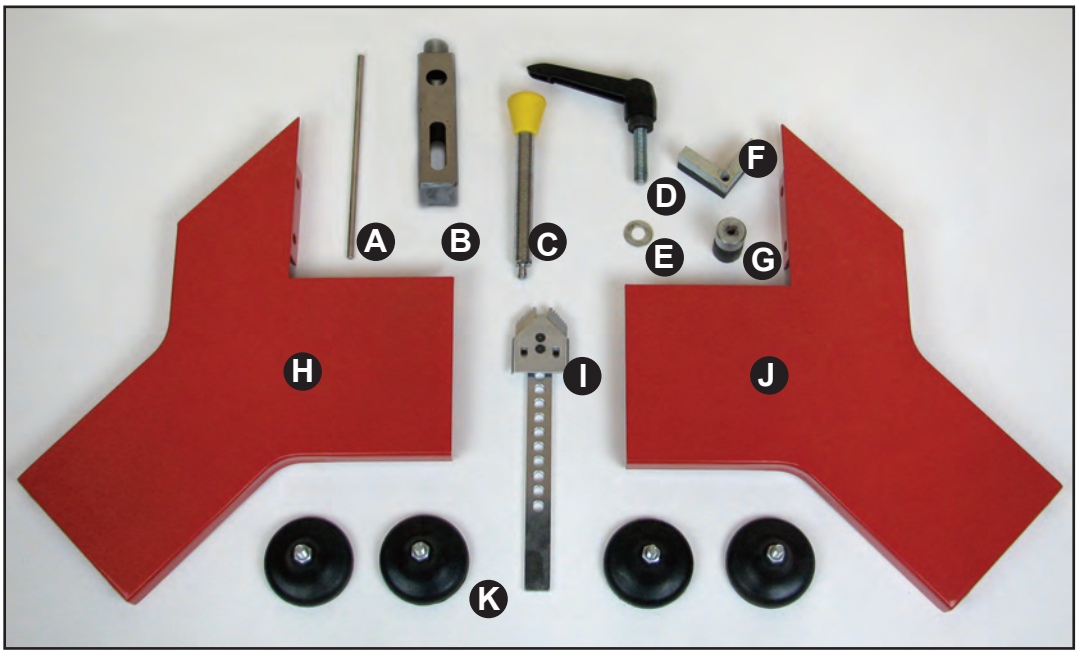
11. Maintain machine in good condition. Keep machine clean for best and safest performance. Follow instructions for lubrication and maintenance.

12. Disconnect the machine from power or source (or air supply) before servicing.

13. Do not use any power tools while under the effects of drugs, alcohol or medication.

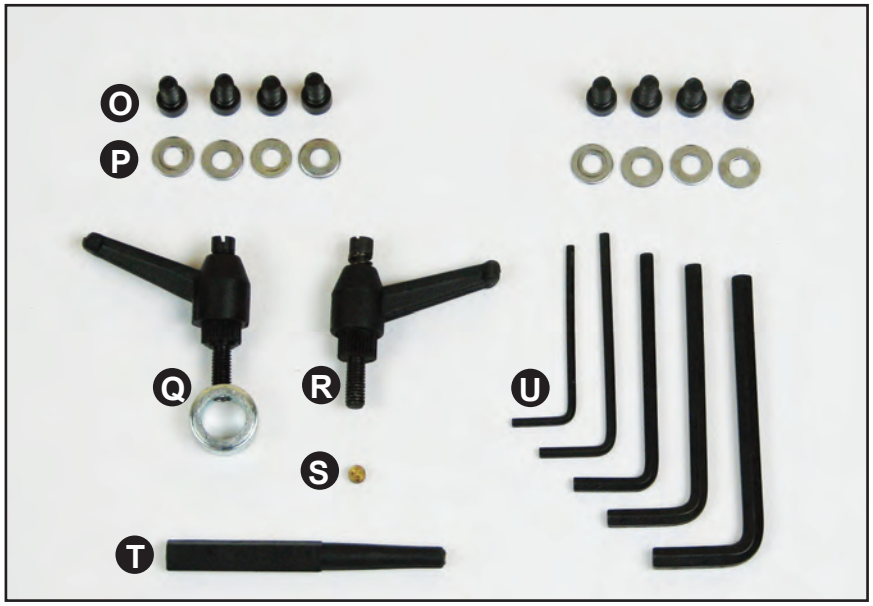
Unpacking Your Underpinner

Check the contents have arrived safely and all the components are present according to the list below.



Large Parts

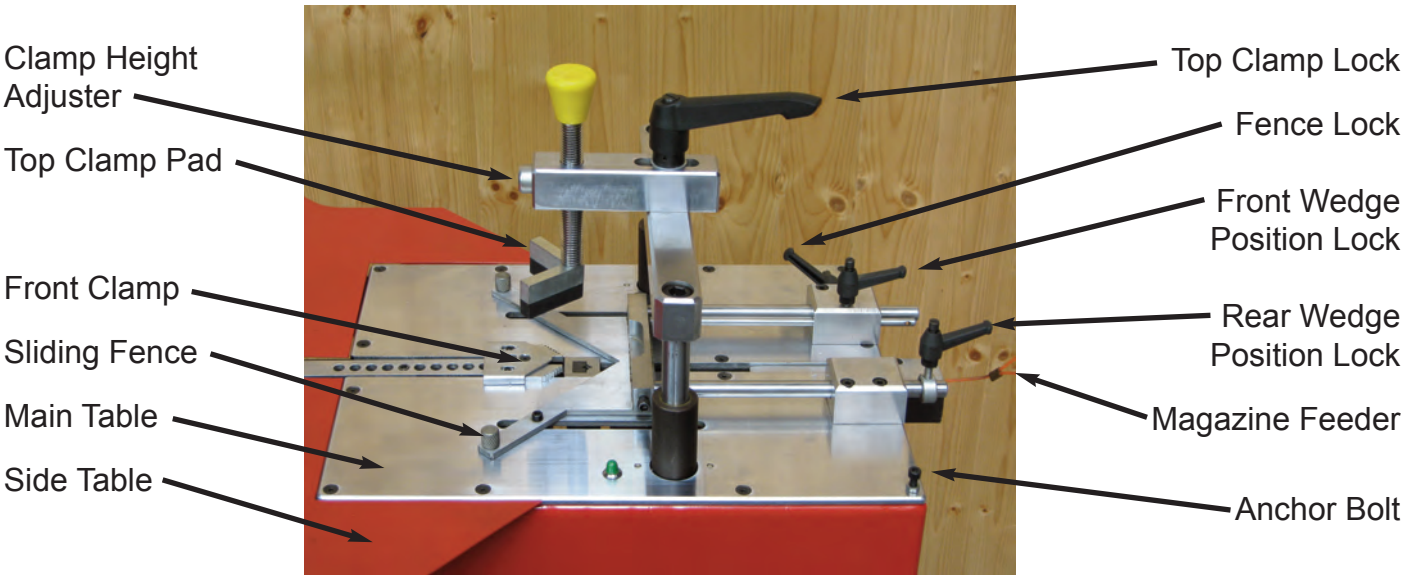
A) Front Stop Bar
B) Clamp Adjuster
C) Vertical Bar
D) Handle
E) Washer
F) L Shaped Pad
G) Round Pad
H) Left Table
I) Front Clamp
J) Right Table
K) Rubber Feet x 4



Small Parts

O) Cap Head Bolt x 8
P) Washer x 8
Q) Locking Collar
R) Locking Handle
S) Brass Nipple
T) Magentic Tool
U) Set of Hex Keys

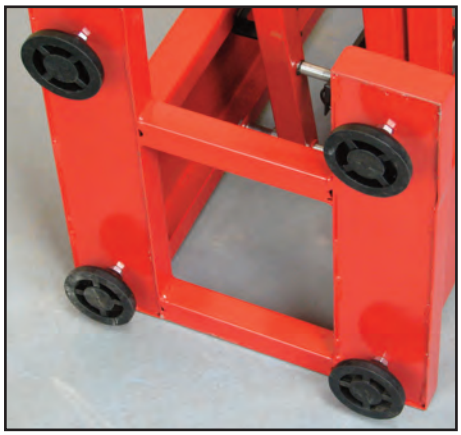
MAIN FEATURES OF THE M3 UNDERPINNER



ASSEMBLY INSTRUCTIONS

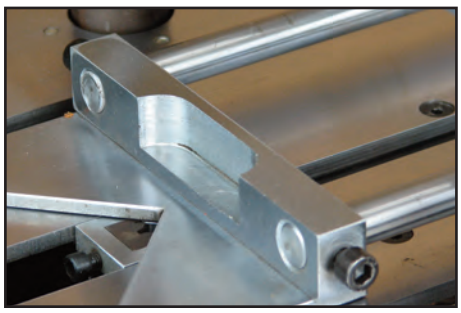
1) Fit the Rubber Feet

Screw 4 feet (K) into threaded holes in the base of the stand. The feet are adjustable in height. Use a 13mm spanner to tighten the locking nut, once the machine has been levelled.

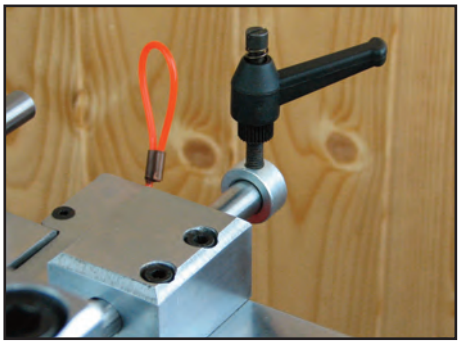


2) Assemble the Fence

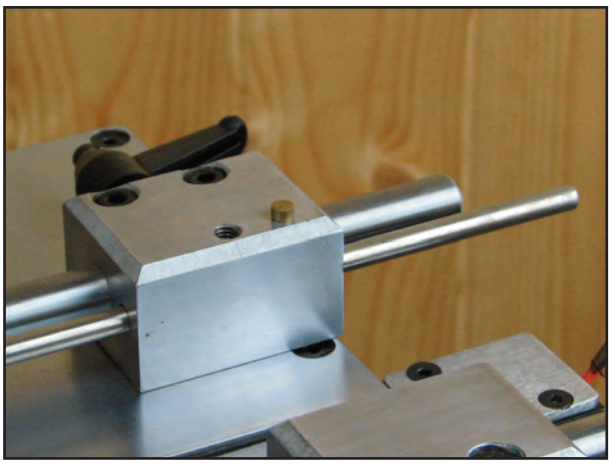
Unlock two cap head bolts using the Hex key supplied. Slide the fence forward until the two round guide bars are flush with the front of the fence bracket.



Fit the Handle and Locking Collar (Q) over the right hand fence bar.

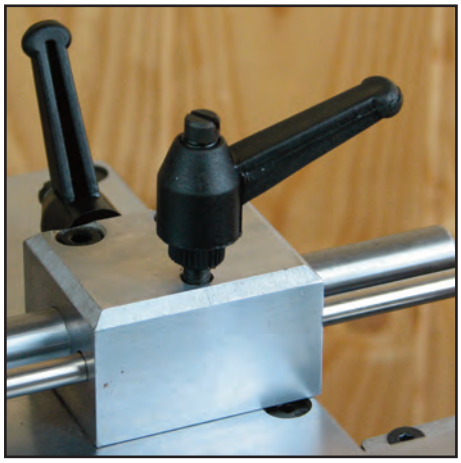


Insert the Front Stop Bar (A) into the hole in the fence block.

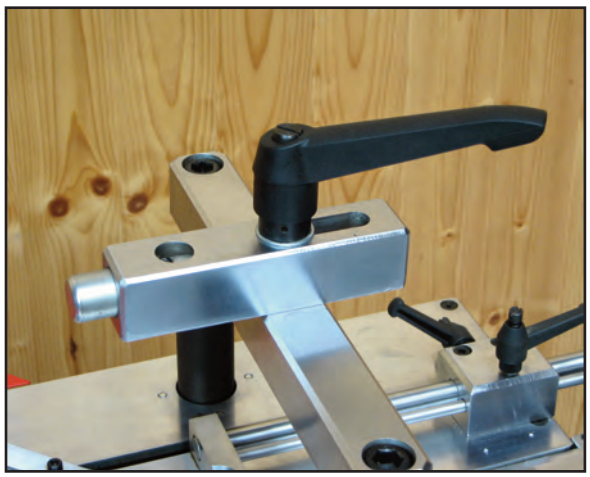


Place the Brass Nipple (S) into the threaded hole in the fence block.

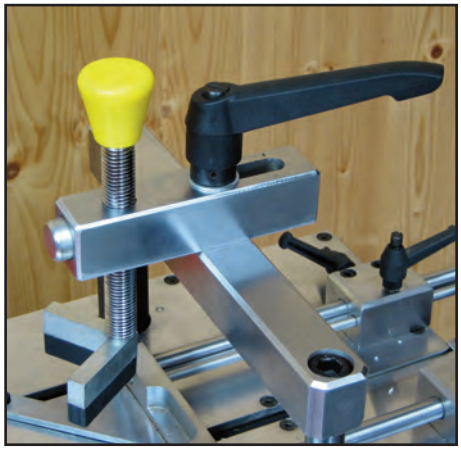
Screw in the Locking Handle (R).



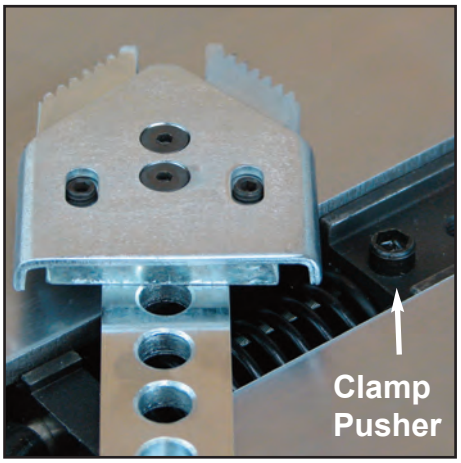
3) Assemble the Top Clamp
Fit the Clamp Adjuster (B) onto the bridge and secure in place with Washer (E) and Handle (D).



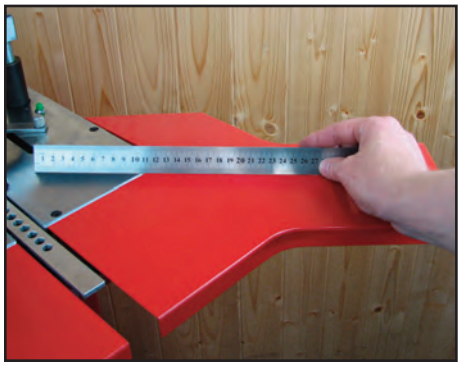
Push the adjusting button inwards and insert, from above, the Vertical Bar (C).
Screw the L Shaped Pad (F) onto the end of the vertical bar.



4) Assemble the Front Clamp
Position the Front Clamp (L) so that one of the round holes aligns over the Clamp Pusher.



5) Assemble the Side Tables
Use 8 Cap Head Bolts (O) and Washers (P) to fit the 2 Side Tables (H&J).
Use a straight edge to set the level of the tables flush with the main table.

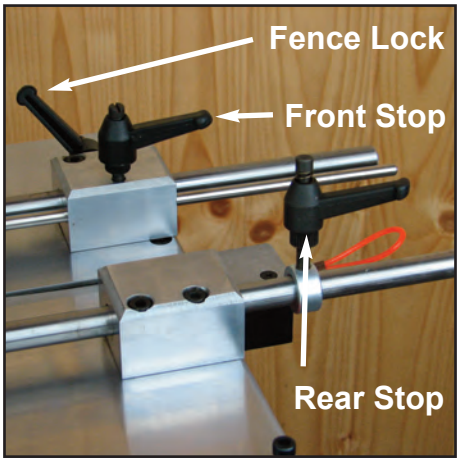


OPERATING INSTRUCTIONS

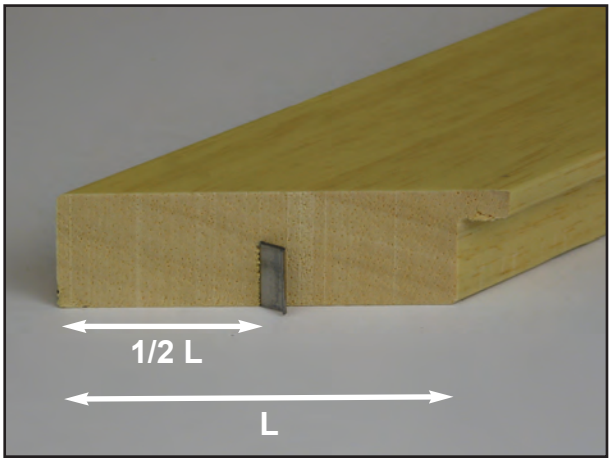
6) Remove the Footpedal Locking Clamp
For safety during transport the main pedal is locked down. Undo the handle and slide the Locking Clamp upwards, allowing the pedal to move up at the same time.

The Locking clamp can also be used to lock the footpedal half way down, This reduces the amount of travel required to insert a wedge and is sppeds up th epinning operation when working with small mouldings.

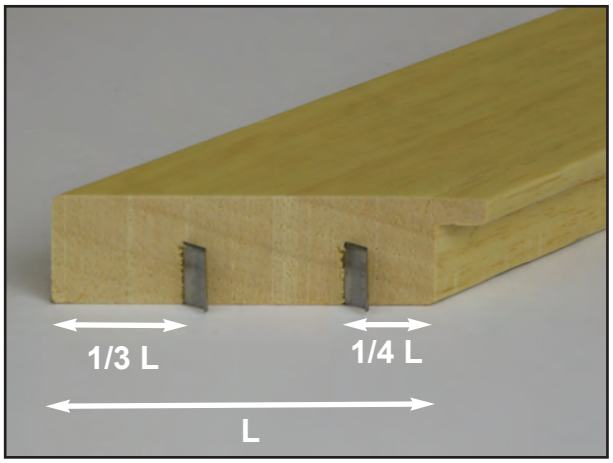
1) Set the Fence
The fence will slide smoothly forward and back. This allows wedges to be inserted into any position on the moulding.
The fence is fitted with a limit stop to set the front wedge position and a limit stop to set the rear wedge position.



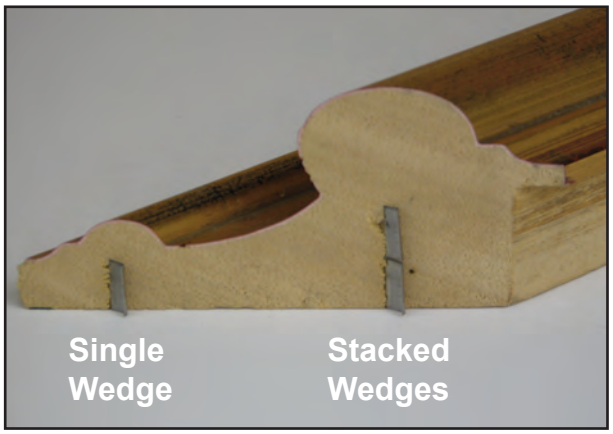
When inserting only one wedge into a corner, the position should be central.



When inserting 2 or more wedges into a corner the first position should be 1/4 distance from the front edge. The last position should be 1/3rd distance from the back edge.



There is also a lock to hold the current position. This is used when ‘stacking’ wedges. Stacking is the process of inserting multiple wedges in the same position. The second, and subsequent wedges, will drive the first wedge deeper creating a stack.
Using this method 2 x10mm high wedges will become a 20mm high wedge.

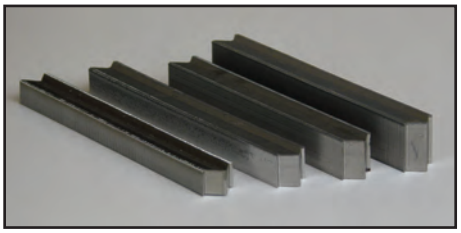


3) Select the Appropriate Sized Wedge

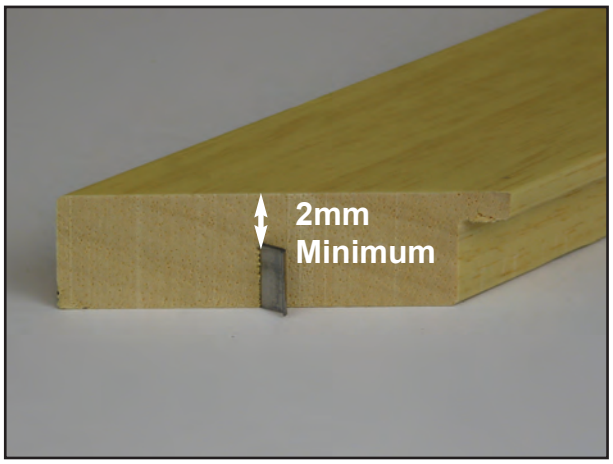
The M3 can use wedge (V-nail) sizes 7mm, 10mm, 12mm and 15mm.

Please Note: Only use **Genuine Framers Corner Universal** wedges 10.3mm Width, supplied in glued strips.

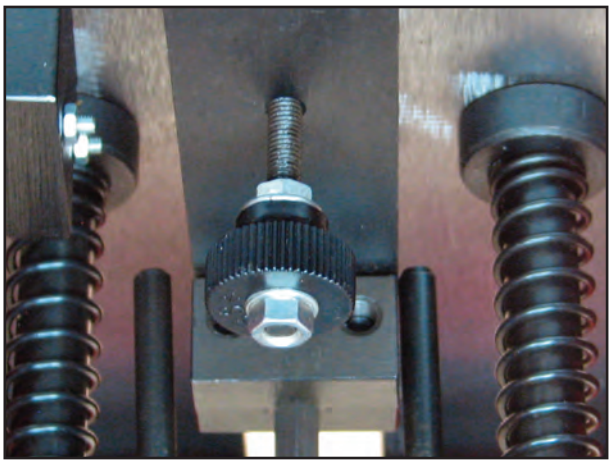
The warranty will be void if the wrong type Wedges are use.



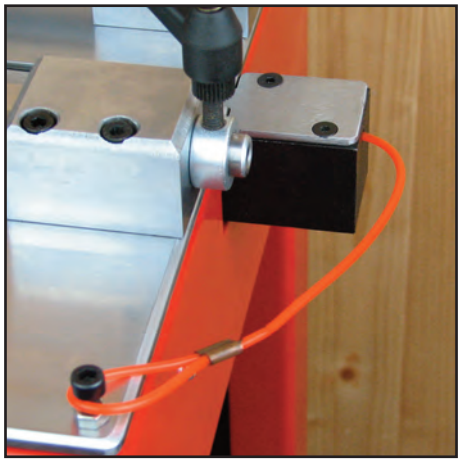
There must be a mimumum of 2mm between the top of the inserted wedge and the face of the moulding.



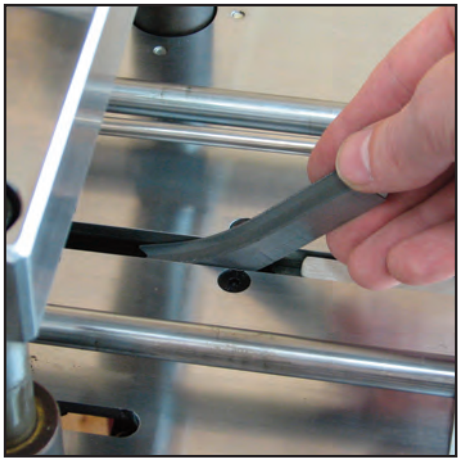
4) Load the Magazine
Adjust the height of the wedge magazine using the round knob located underneath the magazine.



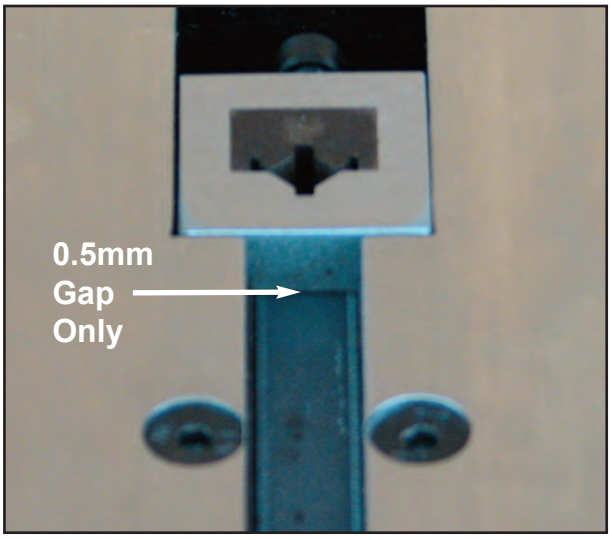
Pull back the nylon cord and hook the looped end over the anchor bolt.



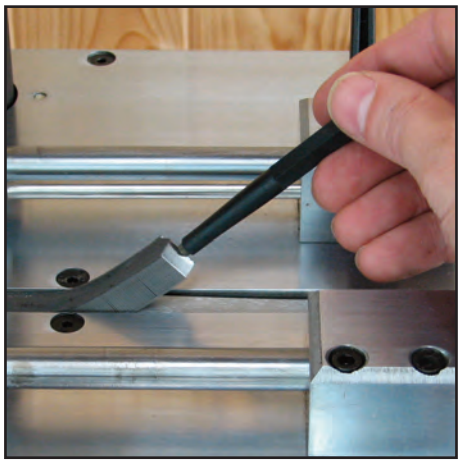
Insert a strip of wedges, sharpened side upwards. When using genuine Framers Corner Wedges, insert with glued side up.



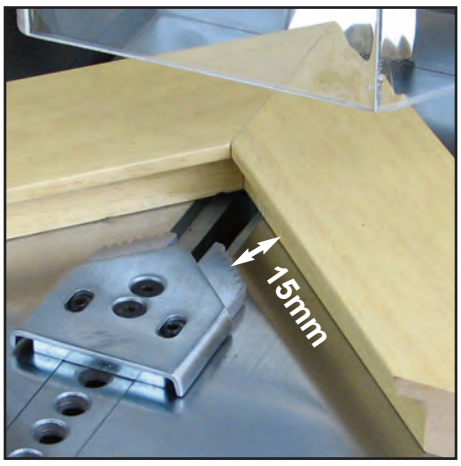
Unhook the nylon cord and gently let the spring push the strip of wedges into the magazine.
Use visual observation to confirm that the wedges slide under the cap with a gap of no more than 0.5mm.



To remove wedges from the magazine, reverse the proceedure.
Use the Magnetic Tool (T) to pull the partly used strip of wedges, out of the magazine.



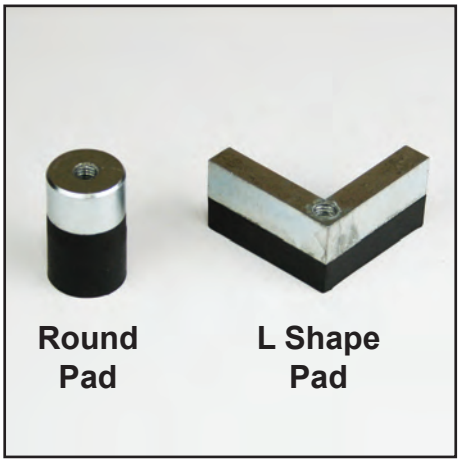
5) Set the Front Clamp
The front clamp grips the moulding by the rebate. The clamp holds the moulding securely even when moving from one wedge position to another. Place a piece of the moulding to be used against the fence. Press and hold down the right hand footpedal. The clamp pusher will travel backwards.
Fit the clamp over the clamp pusher, in such a way that tip of the clamp is within 15mm of the moulding.



Release the foot pedal and the clamp will move forward, gripping the moulding.
The tip of the clamp is desgined to allow for slight variations in the moulding width.

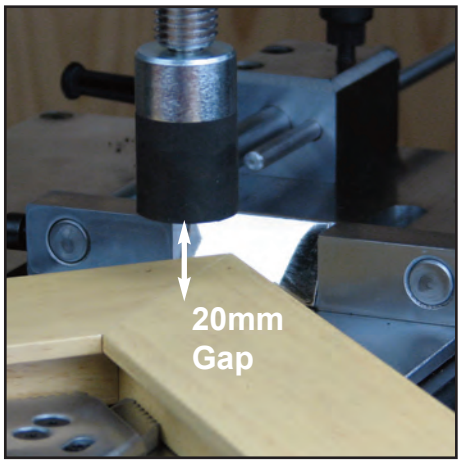
6) Choose the Appropriate Rubber Pad

The pinner is supplied with 2 rubber pads. For flat moulding the round pad is generally better. For profiled moulding with varying heights the L shaped pad is generally better.



7) Set the Top Clamp

It is important to set the height of the top clamp correctly. Place the moulding to be used against the fence. Set the gap between the lowest point of the moulding and the underside of the rubber pad to 20mm. To adjust the height, press the round button forward to release the vertical bar. Slide the clamp up or down as required. Release the clamp adjusting button.



8) Insert the Wedge

With all the above settings made:

- Push the fence into the back position
- Press down and hold the right hand pedal
- Place 2 mitred pieces against the fence
- Release the right hand pedal
- Visually check the joint is tight
- Press the left hand pedal firmly all the way down until the light comes on.

- Release the left hand pedal

If a second wedge is to be inserted;
Slide the fence and moulding to the next wedge position and use the left hand footpedal again. Do not press the right hand pedal until all of the wedges required have been inserted into the corner.

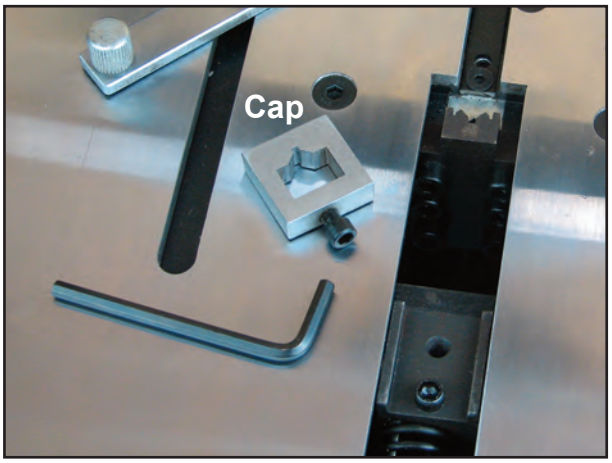
During the cycle the top clamp will travel down and contact the moulding, then the driver will push one wedge into the underside of the moulding.

Please note: It is recommended that a suitable glue is always used when making a frame. Apply a small amount of glue to one of the mitred ends before loading into the pinner. The glue will give the frame strength and ensure it lasts for many years.

ROUTINE MAINTENANCE

1) Cleaning
Clean any excess glue from around the wedge exit point.
Clean the top of the table using a silicone spray or similar product to allow the fence to slide smoothly.

2) Clearing a blockage
Occasionally, a wedge may get jammed in the magazine. It may be possible to pull the wedges out by hand. If it is firmly stuck, possibly half in and half out, It is highly likely that the driver will also be stuck in the raised position.



To clear a blockage; remove the cap, using the hex key provided. Once removed, the driver should drop back down and the jammed wedge can easily be removed.
When refitting the cap, ensure the top is flush with the surface of the surrounding table.

3) Replacing the Driver
The driver is the part which takes the most wear and will, one day, need replacing.

ii) Use a hex key to remove the Cap.
iii) Undo the hex bolt which secures the bottom of the driver to the driver holder.
iv) Push the driver up through the main table and remove it from the top.

When fitting the new driver ensure the V shape lip is uppermost, with the point of the V towards the back of the machine.
Before tightening the hex nut, ensure the driver is firmly pressed against the bottom of the holder.

4) Changing the Rebate Clamp Cable
i) Remove the 2 Cap Head screws (Part 15) which hold the Clamp Support Arm (Part 12)
ii) Remove the 2 Cap Head screws (Part 79) holding the Clamp Cast (Part 62) to the fence. Drop Clamp Cast down through the machine.
iii) Remove Guide Bar (Part 61) and carefully remove Clamp Block Spring (Part 82). This will release the Clamp Block (Part 81) allowing the Inner Cable to be removed from the Clamp Bock.
iv) Remove M6 nut (Part 2) on the bottom of the cable, were the cable passes through the Clamp Footpedal (Part 33)
v) Remove the M8 nut on the bottom of the Cable Adjuster (Part 3) where the cable passes through the bracket on the Floorstand (Part 1).
vi) Remove Inner and Outer Cable from Floorstand.
vii) Fit the new cable by reversing the instructions.
viii) Once the cable is replaced, the amount of movement of the Clamp Block (Part 81) must be checked. When the footpedal is fully depressed, the Clamp Block (Part 61) should move between around 20 mm.
ix) The amount of movement can be adjusted by the M6 (upper) & M8 (lower) nuts on the Cable Adjuster (Part 3)

CE Declaration CE

We declare that Manual Underpinner, Model M3 conforms with the following directives:

Machinery Directive 2006/42/EC

And further conforms with the following EU harmonized standard;

EN ISO 12100:2010

The equipment named above has been tested and found to comply with the relevant sections of the above referenced specification. The machinery complies with all essential requirements of the directive.

A copy of the declaration is available by contacting framers corner.

Fault	Cause	Remedy
Wedges are too wide to load into the maga-zine	Wrong type of wedges	Only Universal type 10.3mm wedges can be used
	Faulty wedges	Check with wedge supplier
No wedge is inserted into the moulding	The wedge magazine is empty	Reload the magazine
	Wedge feeder spring is not engaged	Release the nylon cord, check the push spring is moving freely
	Wedge is jammed in cap	Clear the blockage (see page 10)
Fence does not slide	Build up of dirt	Lubricate the two sliding fence bars (part no. 45)
Top clamp is marking the moulding	Wrong pressure pad fitted	Change to alternate shape pad
	Pressure pad is worn or damaged	Replace pad
Bad joint - Open joint	Bad mitre	Check mitring machine
	Moulding moving during pinning	Ensure the base of the moulding is flat
		Move the wedge position away from the back edge
Moulding is moving during pinning	Cap not flush with table	Remove cap and refit it (see page 10)
	Extension tables not flush with table	Reset the tables
	Top clamp not set correctly	Set gap between moulding and pressure pad to not more than 20mm
	Front clamp not set correctly	Set gap between moulding and clamp to not more than 15mm

Fault	Cause	Remedy
Wedges not fully inserted into moulding - Light does not illuminate	Pedal stroke incomplete	Press pedal until the light illuminated
	Top clamp set too high	Set gap between moulding and pressure pad to not more than 20mm
Wedges not fully inserted into moulding - Light does illuminate	Microswitch actuating screw requires adjust-ment, Part 67	Loosen locking nut on screw and adjust so that indicator lights when wedge driver is flush with the top surface of the table
Wedges being driven in too deep	Driver limiter not set correctly	Reset the adjusting screws
Attempt at stacking fails	Fence is moving during cycle	Lock the fence when stacking (see page 7)
Stacking wedges break through side of moulding	Stack is too high	Use less or smaller size wedges
	Wedge position too close to edge	Move the wedge position away from the edge
	Wavy grain wood (particularly hardwood)	The wood species is not suitable for stacking
Wedge deforms when inserted	Hardwood	Use specific hardwood wedges
Driver does not return after cycle	Driver has come out of holder	Refit the driver into the holder (see page 10)
Top clamp does not return to start position	Top clamp not set correctly	Set gap between moulding and pressure pad to not more than 20mm
Wedge inserted light does not Illuminate	Battery Flat	Replace Battery - access from front, under the table at rear
